

A. Rosenbaum Bounds

Both effects robust to confounding

Rosenbaum $p < 0.05$ across all tested $\Gamma \leq 50$

δ (migration)

$\Gamma^* > 50$

β (VEGF)

$\Gamma^* > 50$

A null effect would require an unmeasured confounder with odds ratio $> 50\times$ on both treatment and outcome

B. E-values for Unmeasured Confounding
